

AI Prompt Guide for Project Development

Phase 1 : Planning Mode

Never ask the AI to generate the complete project in one prompt.

Instead, first discuss the project and prepare a complete implementation plan.

Step 1 : Introduce Your Project

User

Hi

Step 2 : Ask for Project Ideas

User

I want to develop a project named "Project Name".

Please suggest:

- Objectives
 - Problem Statement
 - Target Users
 - Major Features
 - Optional Features
 - Modules
 - Technology Stack suitable for PHP 5.6 and MySQL 5.6
 - Database Requirements
-

Step 3 : Finalize Requirements

User

I want the following features in my application.

Project Name:

Purpose:

Admin Features:

- ...

User Features:

- ...

Reports:

- ...

Security Requirements:

- ...

Other Requirements:

- ...

Please review these requirements.

Suggest any missing features or improvements before development starts.

Step 4 : Ask AI to Prepare an Implementation Plan

User

I am using:

- Plain PHP (No Framework)
- PHP Version: 5.6.18
- MySQL Version: 5.6.20
- HTML
- CSS
- JavaScript
- Bootstrap (Optional)

Now prepare a complete implementation plan.

Divide the project into small development phases.

For every phase include:

- Objective
- Files to be created
- Database changes
- Expected Output
- Testing Checklist

Do not generate any code yet.

AI will generate something similar to:

- Phase 1 – Project Setup
- Phase 2 – Database Design
- Phase 3 – Authentication
- Phase 4 – Admin Module
- Phase 5 – User Module
- Phase 6 – Reports
- Phase 7 – Search
- Phase 8 – Validation
- Phase 9 – Security
- Phase 10 – Final Testing

Phase 2 : Build Mode

Now develop the project **one phase at a time**.

Never ask AI to generate all phases together.

Step 1 : Build Phase 1

User

Now build Phase 1 only.

Follow the implementation plan exactly.

Generate complete code with proper folder structure.

Explain where every file should be saved.

Do not generate Phase 2.

Step 2 : Test the Phase

User

How do I test Phase 1?

Provide:

- Steps to run
 - Expected Output
 - Common Errors
 - Troubleshooting
-

Step 3 : Fix Errors (If Any)

If an error occurs, do **not** say:

It is not working.

Instead provide complete information:

User

I received the following error.

Error Message:
(Paste complete error)

Current Code:
(Paste code)

Please explain the cause and provide the corrected code.

Step 4 : Build the Next Phase

User

Phase 1 is working correctly.

Now build Phase 2.

Do not modify working files unless necessary.

Only generate new files or updated files required for Phase 2.

Repeat this process for every remaining phase.

Best Practices When Working with AI

- ✓ Clearly describe your project before asking for code.
- ✓ Finalize all requirements before development begins.
- ✓ Ask for an implementation plan first.

- ✓ Build one phase at a time.
- ✓ Test every phase before continuing.
- ✓ Keep a backup after each successful phase.
- ✓ When reporting an error, always share the complete error message and the relevant code.
- ✓ Ask AI to explain the code so you understand how it works instead of simply copying it.
- ✓ If AI changes an existing file, ask it to explain what changed and why.
- ✓ Maintain version folders (e.g., `Project_v1`, `Project_v2`, `Project_v3`) so you can roll back if needed.

Recommended AI Prompt Template

Project Name:
Technology:
PHP Version:
MySQL Version:

Requirements:
(List all requirements)

Task:
(Build only Phase X according to the implementation plan.)

Instructions:

1. Follow the implementation plan.
2. Generate complete code.
3. Explain where each file should be saved.
4. Explain how to test it.
5. Do not generate the next phase.
6. Use PHP 5.6 compatible syntax only.
7. Keep the existing code unchanged unless required.
